

Solutions for medium-sized businesses

SAP Mobile Solutions

SAP goes mobile: SAP connection of your mobile terminals **with** it.x-mobile

itelligence

it.x-mobile makes your SAP data even smarter

SAP data secure, easy to use and always to hand!

»The trend towards the use of mobile terminals such as iPhone, iPad, BlackBerry and Android devices is becoming increasingly marked. But the question is, how can SAP data or entire IT processes be brought to these smartphones and tablets in a secure and easy manner? itelligence has developed a universal framework under the name of it.x-mobile to meet these requirements.«

itelligence AG

The development of a clear strategy for the inclusion of mobile terminals in the SAP landscape is currently occupying many IT departments: Which devices must be integrated? Which data or processes should be available online and/or offline? Which solutions will stand the test of time? How can they be implemented efficiently?

it.x-mobile allows you to transfer your business scenarios to various mobile devices in a simple, secure way. it.x-mobile is made up of the components it.x-mobile Core, it.x-mobile Player, it.x-forms and it.x-sync. These components can be matched to individual customer requirements in the projects.

it.x-mobile can be used as a standalone solution for a quick, slimline introductory solution. In addition, the solution is compatible with the long-term SAP strategy, which uses the SAP NetWeaver Gateway, the SAP Unwired Platform (SUP) and Afaia for device management. This means that, for example, the gateway can be used to create simple B2C (also anonymous) or B2B connections via a low-cost call-by-call license. This compatibility makes it.x-mobile a player for the future and also protects investments.

Online scenarios: it.x-mobile Player

The solution components it.x-mobile Core and it.x-mobile Player allow the implementation of Online and Almost Online scenarios. The core module is an interface specialising in the provision of the required data, which can be configured according to individual customer requirements in ABAP. The XML data provided is then interpreted by the it.x-mobile Player on the terminals and converted. The XML language used offers the option of presenting business scenarios graphically, using preconfigured elements such as input boxes or tables. This means that individual company apps can be developed simply and efficiently and applied to various mobile devices. Currently, we offer this for iOS, Android and BlackBerry.

Architecture Variants

Player Architecture

Offline scenarios: it.x-sync

If specific mobile business scenarios must also be available offline, then this can be implemented using the two solution components it.x-mobile Core and it.x-sync. In contrast to purely online scenarios, it.x-sync can be used to save data to be defined or compared with the SAP EMP on the mobile terminal, allowing its use there. The necessary synchronisations with the SAP system also take place using the solution components. This is interesting for mobile workflow or sales processes, for example.

Process monitor for interactive forms: it.x-forms

If forms with SAP data need to be made mobile, then this can be achieved with the solution component it.x-forms and the Core Module. For example, this could be visit reports, mailed directly from the SAP CRM to the responsible field service employee. When the report has been completed on the mobile device, the forms are returned and the data entered transferred automatically to the SAP CRM.

The following overview shows the various cases. More information on the solution and on various business scenarios, as well as videos, etc., may be found on our special microsite: <http://it-x-mobile.itelligence.de/micro/en>
