

## EDI for Mid-Sized Businesses

# Introduce Transparency to Your EDI with it.x-EDIconnect.

 Many business partners require electronic data interchange (EDI) as standard. They often use solutions that are out of date, either functionally or in terms of operability.

### Connecting to Your Business Partners

it.x-EDIconnect lets you connect to your customers and suppliers to exchange electronic messages. It supports all electronic communication channels and industry-standard data formats such as VDA and EDIFACT to exchange orders, invoices, and delivery and credit notes. You can connect to any business partner using the adapters for X.400, AS2, OFTP1/2, FTP, SFTP, HTTP, email, and file sharing. The solution already supports the e-invoicing functionalities of the ZUGFeRD specification and is OFTP2 certified.

### Independent of ERP

it.x-EDIconnect uses the proven and stable architecture of SAP Business One Integration Framework for SMEs, the SAP integration platform for mid-sized businesses. When used in combination

with it.x-EDIconnect, this technology is entirely independent and compatible with any ERP system. The solution also includes communication adapters and can be directly configured and monitored via a user-friendly interface.

### User-Friendly Interfaces

it.x-EDIconnect stands out due to its user-friendly and modern interfaces, which you can easily access using your internet browser. We have focused on developing intuitive administration, configuration and monitoring input screens for each user group in your IT and specialist departments.

**+250**  
companies

have used our B2B/EDI solutions for all platforms

### Transparent Monitoring

Monitoring for the department provides search content according to EDI data based on business process information. It does not use typical EDI-specific terms, and helps users to ensure the traceability of business processes using document-specific search options such as order, item or invoice numbers. Protocol monitoring allows the IT department to supervise individual activities within business processes and view log information in the event of an error. Technical monitoring provides a real-time tabular overview of all processes executed successfully or incorrectly, and of individual steps within the business process. Incorrectly executed processes can be corrected and re-executed at any time.

### Efficient Connection to Your Business Partners

it.x-EDIconnect gives you a comprehensive and continually growing mapping library, so you can connect new EDI contacts quickly and efficiently. You can opt for mappings from the library, create your own based on proven concepts, or use direct mappings – it.x-EDIconnect supports them all.

### EDI Managed Services

Have you ever thought of outsourcing your EDI solution? Our EDI managed services provide full cost transparency and offer all the same options as your on-premise system. As well as connecting you to your business partners, we can provide interfaces for other cloud solutions like SAP Hybris Cloud for Sales and web shops. Since security and availability are vital, operations are conducted at our own SAP- and ISO-certified data center in Germany, offering guaranteed 99.5% availability and 24/7 operation.

 We have focused on developing intuitive administration, configuration, and monitoring screens for each user group in your IT and specialist departments.

#### Advantages at a Glance

- Individual user interfaces for every application in specialist and IT departments
- Transparent EDI processes using specialist, technical, and protocol monitoring
- Easy connection to your business partners and access to a wide range of mappings at a fixed price
- ERP independence with consulting expertise for connecting to external business partners and many internal systems
- EDI managed services offer total cost transparency and reduce your IT department's workload
